

Shareholder Briefing | Product Usability

# Four Working Value Engines, Seen From The User's Chair

A walk through the functional value streams of Market Intelligence as customers actually operate them: what they click, what they get, and the market evidence that each capability moves numbers a business cares about.

Production application | [www.majikl.com](http://www.majikl.com) | Screenshot placeholders ready for live captures

# Why Usability Is What We Are Reporting

Software creates shareholder value only when customers can operate it without us in the room. This briefing therefore reports the product as a set of functional value streams: end-to-end processes a customer completes on screen, each ending in a work product that moves a KPI. The language and stream numbering come directly from our value stream analysis, so what you hear today reconciles line by line with that document.

1

## What You Will See

Live screens with the exact clicks a customer performs, one screenshot frame per capability.

2

## How To Judge It

Each section opens with the business question it answers; each slide names the value streams at work.

3

## Where The Numbers Come From

Market metrics are third-party research, cited on the slide where they appear, never our own estimates.

*One ask as we go: judge every capability by the question at the top of its section. If the screen does not answer the question, say so.*

# Table Of Contents

|                                                                                                                                      |                                                              |           |

# Four Sections, Seven Value Domains, One Question Each

1

## Automated Content Production + Research, Market Awareness

*How do we publish credible content constantly without a writing staff, and know what to say first?*

Domains A, D

2

## Visual Content

*How do we raise engagement per post without a design team?*

Domains B

3

## Organization Analytics + Advocacy Amplification

*How do we know what worked, then multiply reach through our own people?*

Domains E, F

4

## Capacity, Cost, Continuity

*How do we scale output while controlling spend and risk?*

Domains G

*Language and stream IDs follow the company's value stream analysis; every section shows the live screen a customer uses.*

# The Content Engine Starts With A Topic, Not A Writer

A customer types a topic they want to own. The platform proposes ten content angles, discovers the industry feeds worth trusting (each validated and graded before acceptance), and begins reading the market on a schedule. No writing staff was hired in the making of this pipeline.

## Usability On Screen

- Create a topic in one form; accept AI-proposed angles (D1)
- One click discovers feeds; each arrives graded before joining (D2)
- Articles populate the research monitor; refresh on demand (D4)
- The radar runs while the customer sleeps (A1)

Value Streams: D1, D2, D4, A1 | Domains A, D

2x

Businesses posting weekly on LinkedIn see twice the engagement of inconsistent publishers. Consistency is exactly what automation guarantees.

# From Research To A Post A Human Approves

Every draft is born researched: sources read live, claims corroborated across independent outlets, verified figures inserted mechanically so the AI never types a number. The customer reviews a queue, edits or one-click rewrites, and approves. Nothing publishes without that click.

## Usability On Screen

- Generate on demand or let the twice-daily cycle draft (A1, A2)
- Every draft carries a named primary source, or it does not exist (A4)
- Review, edit, rewrite, approve; schedule to the minute (A5, C2)
- One pipeline posts to the company page or a personal profile (C3)

Value Streams: A1 To A5, C2, C3 | Domains A, D

84%

Of B2B marketers say LinkedIn delivers their best platform value. This engine feeds that channel a defensible post at a time.

*Source: Cognism LinkedIn Statistics, 2026*

# A Design Team In A Side Panel

Inside the post editor, the customer opens a gallery: free images harvested from the source articles, plus an AI studio that paints from the post's own research in the company palette, within a hard dollar budget. Attaching the right image is one click, and it is the single cheapest engagement lever we ship.

## Usability On Screen

- Open the gallery; article imagery is already waiting (B3)
- Generate a custom image from the post's brief, on palette (B1)
- Refine in plain words; reuse from the library (B2)
- Every render prices itself against the owner's budget cap

Value Streams: B1, B2, B3 | Domain B

## +98%

More comments on LinkedIn posts that carry an image versus none. Video earns 5x static engagement; imagery is the floor, not the ceiling.

*Source: LinkedIn data via Cognism, 2026*

# Numbers Leadership Can Repeat Out Loud

The analytics page syncs real LinkedIn results: per-post metrics, topic rollups, a day-by-hour heatmap of when the audience actually engages, and follower demographics. A value not yet retrieved says so; nothing is dressed up as a zero. The one-click narrative cites every figure it states, or it refuses to render.

## Usability On Screen

- Sync organization metrics on demand (E1)
- Read the heatmap; let it retune posting hours (E3)
- Generate the cited executive narrative (E2)
- Benchmark honestly against a 3.8% platform average

Value Streams: E1, E2, E3 | Domain E

[ ]

**3.8%**

Average LinkedIn engagement rate. Our heatmap and topic rollups exist to beat the benchmark with evidence, not anecdotes.

*Source: Cognism LinkedIn Statistics, 2026*

# The Reach Multiplier We Do Not Pay For

One click fans a published company post into personal variants, one per consenting employee, written in each person's voice from notes they provided. Members approve their own; publishing uses their identity, never the brand's. The market math on this is the strongest in social.

## Usability On Screen

- Select a published post; generate per-member variants (F1)
- Members approve, edit, or decline their own version (F2)
- Track activated reach v. page followers on one card (F3)
- Consent is architectural: joining, leaving, voiding are member-owned

Value Streams: F1, F2, F3 | Domain F

[ ]

8x

Engagement on employee-shared v. brand-shared content; employee networks average 10x page followers; advocacy leads convert 7x.

# Scale The Output, Cap The Spend, Keep The Receipts

The admin page is where an owner runs the business side in minutes: invite editors and viewers under strict roles, choose the AI vendor and validate its key before a cent flows, watch a 30-day spend ledger by provider, and trust connections that renew themselves and complain loudly when they cannot.

## Usability On Screen

● Invite the team; roles enforce who drafts, approves, observes (G1)

● Bring your own AI vendor; keys validate before storage (G2)

● Read the spend ledger; image budgets refuse past their cap (G3)

● Publishing tokens self-renew; failures surface, never silent (G4)

Value Streams: G1 To G4 | Domain G

63%

Higher engagement on personal profiles (2.60%) v. company pages (1.74%): the dual-audience pipeline this platform governs at zero added headcount.

Source: Metricool LinkedIn Study, 2026

The Takeaway

# Usability Is The Investment Thesis

**Publish constantly without a writing staff**

Topics in, approved posts out; weekly consistency is automated

**2x engagement for consistent publishers**

**Raise engagement without a design team**

One-click imagery from the post's own research, on budget

**+98% comments on image posts**

**Multiply reach through our own people**

Consent-first variants in every employee's voice

**8x engagement, 10x network, 7x conversion**

**Scale while controlling spend, risk**

Roles, validated keys, budgets, self-healing connections

**Zero surprise invoices by design**
